EXPERIENCE

Software Architect

Eoptic, Inc.

Jan. 2024 - May 2026 Williamson, NY

- Architected and developed a software platform that aggregates **real-time IoT device messages** to give oil & gas managers a bird's eye view of events occuring around job sites with intrinsically-safe device requirements. **Led a small team** to develop a platform including mobile and web frontends, a **Rust** backend using **GraphQL, Redis, PostgreSQL, InfluxDB, Docker Compose and Gitlab CI/CD** to ensure deployability to both on-site and office on-premise servers.
- Leveraged **Tokio runtimes** and **Protobuf** serialization to develop highly concurrent and efficient asynchronous data pipelines and connectors for real-time IoT device message handling between on-premise services and 3rd party system integrations. Created **ROS2** nodes in Rust to integrate imaging system and IMU data with Anduril, Sapient, ATAK, and in-house platforms.
- Assumed the role of **System Security Officer** to become the company's PoC for cybersecurity compliance to support the COO through **ATO requirements** and the System Owner through **CMMC L2** preparations with C3PAO assessors by developing a **System Security Plan**, managing **policy and procedure documents**, setting up automated **GRC systems**, managing **POA&M** items and clarifying & verifying **NIST control implementations** to create a secure software development lifecycle.

Security Software Engineer | Team Lead

RIT Software Design Lab - DHS/CISA Contract

Dec. 2022 - Dec. 2023 Rochester, NY

- Managed a small team of developers to create a friendly and efficient **AGILE** software development environment. Created ordered and well-defined tasks on a Kanban board to ensure smooth, asynchronous feature development. Gained a deep understanding of industry-standard **SBOM** projects as well as proprietary SBOM tools to demo software progress to customers and consult remote developers across teams.
- Developed a reporting tool for software vendors to attest to **secure software development life cycle** policies with **Angular and Node.js**. Using NIST's **OSCAL** framework, reports can be created combining manual attestations and automated assessments.

TECHNICAL SKILLS

Languages	Rust, Python, Dart, C++, Typescript, C, x86 Assembly
Web	Flutter, REST, GraphQL, Supabase, JWT, Certificate Management
Cloud and Systems	Windows, Ubuntu, Proxmox, Azure
Security	OpnSense, Wireshark, CIS-CAT, NIST, OSCAL, STIG SCAP, Intune
Databases	PostgreSQL, MongoDB, MySQL, Redis, InfluxDB
Tools	Bash, Git & Gitlab, Docker Compose, Open Source GRC, Ansible, LaTeX

EDUCATION

Computing Security BS

Rochester Institute of Technology

August 2019 – December 2023

Alumni

RIT's Computer Science House

August 2019 - December 2023

PROJECTS

Fear & Greed

[Rust] [Mikrotik] [Linux] [Colocation]

- Two servers networked and colocated in a datacenter in Albany. Greed is a **Solana RPC node** that ingests every transaction on the solana blockchain in real-time. Fear decides which tokens are worth tracking and collects their transactions for **backtesting trading algorithms** and discovering arbitrage opportunities. Unifies parsing historical blockchain data with real-time transaction monitoring to explore and optimize trading strategies.

SploreNews

[Rust] [Flutter] [Language Models]

- A news aggregation and exploration **mobile app built with Rust and Flutter**, leveraging **language models** to provide personalized content recommendations and insights.
- Backend collects token prices and news articles from various sources, allowing text search, filtering based on token and news category, grouping similar articles based on event, and chronological ordering with price data.
- Frontend uses a **unique sliding tray design** for a natural user experience when collecting and interacting with news articles.

ChatCMMC

[Python] [NIST] [OSCAL] [LM Studio]

- **LLM Harness** that automatically applies context about **NIST SP 800-171** controls and their related **NIST CSF** controls to prompts.
- I've used this to help determine how different, but related controls should be grouped into **policies and procedures** for assessors, to assist with exploring different implementation techniques for gaining compliance with certain controls, to explore the differences between the various revisions of **NIST SP 800-171** and to reference other **NIST frameworks** like **SP 800-18 Risk Management** and **SP 800-218 Secure Software Development Framework**.
